

Divyansh Singh

Software Engineer II | Frontend Infrastructure, Developer Tooling, and CI/CD

Bengaluru, Karnataka, India | (+91) 7394926646 | rgndunes@gmail.com
[linkedin.com/in/rgndunes](https://www.linkedin.com/in/rgndunes) | github.com/RgnDunes | rgndunes.github.io/Portfolio-v5

PROFESSIONAL SUMMARY

Software Engineer II with 5+ years building React and TypeScript products, frontend infrastructure, developer tooling, and CI/CD systems. At Rippling, cut successful-build P90 from 81 to 52 minutes, reduced one product's eager import graph from 11,516 modules to 54, and built tooling for test reliability and incident response. Earlier at Razorpay, led an internationalization SDK adopted by 27+ teams and downloaded 100,000+ times per week.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, HTML, CSS

Frontend: React, Redux, Zustand, Micro-frontends, Internationalization, Accessibility, Web Performance

Cloud, CI/CD, and Developer Tools: AWS IAM, AWS Secrets Manager, AWS CodeArtifact, S3, Buildkite, Datadog, Vite, Rollup, Webpack, Git, Slack API, Terraform

Testing and Engineering: Playwright, Jest, React Testing Library, Mock Service Worker, Observability, System Design, Software Architecture, Performance Optimization, Incident Response, Root-Cause Analysis, Monorepos, Technical Mentoring

PROFESSIONAL EXPERIENCE

Rippling

Software Engineer II, Web Infrastructure

Jun 2025 - Present

Bengaluru, India

- A Vite 8 benchmark showed that eager route imports, rather than the dev server, were the larger local-development bottleneck. Reworking those imports cut one product's graph from 11,516 modules to 54 and finished-loading time from 90 seconds to 10.54 seconds; the same analysis was then applied across six product areas.
- Converted safe integration-test suites from serial to parallel execution across ten product and platform domains. Successful-build P90 fell from 81 to 52 minutes, backend pull-request P90 from 76 to 40 minutes, and frontend pull-request P90 from 88 to 58 minutes; shared-state tests remained serial.
- Replaced permanent package credentials with 12-hour IAM-backed tokens across three repositories and verified five CI scenarios. After CodeArtifact hit a quota limit, moved the flow to AWS Secrets Manager.
- Created a flaky-test detection pipeline that runs the full suite 20 times against a known-green commit and calculates scores at test and module level. Results are published to Datadog, an S3-hosted dashboard, and Slack.
- While adding deployment-blockage telemetry, found that Datadog rejects timestamps older than 18 hours and that a daily job would lose about 70% of records. Split processing into four six-hour windows so missed runs recover data without gaps or duplicates.
- Moved an internal developer CLI into the primary frontend monorepo, raised function coverage to approximately 100%, and removed its root-directory assumption so independently deployed applications can resolve shared configuration and binaries.
- Moved service-ownership metadata out of backend, frontend, and mobile repositories into one source of truth. Updated Python, JavaScript, and Terraform consumers and added CI checks for mass deletion, missing owners, and reintroduced fields.

Rippling (continued)

- Replaced weekly manual on-call reporting with a Buildkite job backed by the Slack API. It categorizes 50+ support queries and reports response time, timezone, ownership, and query trends, saving 1-2 hours per week.
- Analyzed about 90 on-call engagements across 11 weeks and designed owner-first P1 incident automation. It resolves service ownership, opens incidents with build context, pages the owning team's escalation chain, and treats infrastructure on-call as a two-hour backstop. Replaying the reference week showed that 6 of 9 incidents would not have paged Web Infra first.
- Bundle failures could occur before Datadog RUM, LogRocket, or Sentry initialized, leaving no direct signal. Added a browser beacon and backend endpoint that records the failure mode, deployment context, and affected script before application startup.

Razorpay
Senior Frontend Engineer; Software Development Engineer I; Frontend Engineer Intern

May 2021 - Jun 2025
Bengaluru, India

Senior Frontend Engineer, Internationalization

Nov 2024 - Jun 2025

- Shipped region-aware payment flows for Malaysia and Singapore, enabling 530 merchant activations and supporting MYR 80 million in monthly gross merchandise value.
- Owned the architecture and roadmap for i18nify-js, an open-source internationalization SDK used by 27+ teams and downloaded 100,000+ times per week.
- Replaced Webpack with Rollup and cut the SDK bundle by 30%. Partial imports removed another 1.6 MB from consumer bundles while retaining ESM, CommonJS, and UMD distributions.
- Added RTL-ready components to the company design system, reaching 19+ product teams. Mentored five frontend engineers who went on to own features independently.

Software Development Engineer I, Payments Platform and Internationalization

Aug 2022 - Oct 2024

- Shipped a Mastercard biometric authentication experience demonstrated at Global Fintech Fest 2024. It improved payment success by 35% over 3DS OTP and increased card payments by 33%.
- Cut the time needed to launch a new geography from 8-9 months to one month by extracting reusable internationalization and region-aware platform layers.
- Created an LLM-assisted static-analysis CLI for localization gaps and region-specific hardcoding. It reached 97.3% accuracy across 1,000+ scenarios and was adopted by seven frontend teams.
- Split the Merchant Dashboard into micro-frontends, reducing build and unit-test time by 67% and end-to-end test time by 70%.
- Delivered a token lifecycle system for four banks that enabled 800,000+ tokenizations and reduced risk by 40%.

Frontend Engineer Intern, Risk and Payments Platform

May 2021 - Jul 2022

- Halved payment-dispute resolution time from 20 to 10 minutes and revamped a risk-management interface, increasing engagement by 33% while reducing load time by 21%.

SELECTED PROJECTS AND PUBLICATIONS

i18nify-js: Open-source JavaScript, React, and Go internationalization monorepo with automated testing, modular documentation, and 100,000+ weekly npm downloads.

CompliQ: Chrome extension that helps developers simulate color-vision, keyboard-navigation, and screen-reader accessibility issues.

Technical Author: Wrote Full Spectrum JavaScript (200+ copies), CSS Unmasked (50+ copies), Frontend System Design Decoded (70+ copies), and long-form articles on frontend infrastructure, performance, React, testing, and system design.

EDUCATION

Kalinga Institute of Industrial Technology
Bachelor of Technology in Computer Science Engineering
CGPA: 9.24/10; KIIT Scholar

Jul 2018 - May 2022
Bhubaneswar, India

RECOGNITION

- Earned four Razorpay SPOT awards for ownership and engineering impact.
- Placed 10th among 2,072 teams in the GlobalShala 2.0 Hackathon and received a USD 1,000 Northwestern University scholarship.
